Field of the Invention The present invention relates to a pattern forming method, a pattern forming device and an electronic device. In particular, the present invention relates to a method for forming a fine pattern that is formed by generating a focused ion beam (FIB), and a device and an electronic device equipped with the pattern forming method. 2. Description of the Related Art In recent years, it is said that the number of microfabricated functional devices (for example, memory, CPU, camera, and sensor) is increasing in semiconductor devices. Such a microfabricated functional device is fabricated through the steps of forming a structure (for example, resist pattern) having a desired pattern on a substrate (for example, silicon wafer), and etching (for example, dry etching) the substrate. For forming the pattern, the focused ion beam method (hereinafter, referred to as the FIB method) has been used. The FIB method is a technique for forming a desired pattern on a substrate by implanting ions from an ion source into the substrate and processing the substrate. The FIB method is a technique for controlling the ion implantation energy, the ion implantation amount, and the like by measuring the implanted amount of ions with a secondary ion detector (for example, an electron detector) after the ion implantation, and correcting the implantation conditions based on the measured implanted amount of ions. The FIB method has a merit that a fine pattern having a fine line width can be formed at a high resolution. The FIB method is considered to be suitable as a method for forming a microstructure in semiconductor devices. FIG. 6 shows a conventional device of the FIB method. An ion source 10 is a charged particle beam source, and an electron detector 20 is a charged particle
