cathode materials with a much higher concentration in the biofilm than in the cell body, but not as a coating, but instead as a diffusion layer on top of the carbon material. Sulfate was reduced in the cathode compartment and a small amount of oxygen could diffuse to the biofilm in the anode compartment, resulting in the formation of MoS<sub>2</sub>. Only SRB showed MoS<sub>2</sub> formation, whereas SOB did not. In the MECs using acetogens and SOB, a small amount 2d92ce491b
