June 4, 2564 BE - Basic Connectivity Check: Address Check.

Ping is a simple command that allows you to determine if a particular address is active and responding. `ping -l -c a.dns.net -l` is the command that will ping the a.dns.net address. You could write this command like this: `ping -l -c a.dns.net`. When this command is executed, it will send queries to a.dns.net using its IP address 192.168.1.50. If you do not see a response, then most likely you do not have an Internet connection enabled. But if you see a response, make sure you have the full address on the command line and that you are using the correct parameters (hostname and protocol). fffad4f19a
