Conversion Therapy
Surges in the Media and Private Sector Family Therapists
Say Public Discourse Fails to Prepare or Support Them
Family therapists say it's the most effective strategy they
can offer to help LGBTQ youth deal with the social,
family and other issues that often contribute to negative
outcomes. NARFT Position Statement on Conversion
Therapy At the NARFT's Annual Conference in Orlando
in October 2017, NARFT President Jonathan Arnold
presented a position statement on conversion therapy
(Therapy to Change Sexual Orientation and/or Gender
Identity) that he'd drafted based on the work of the
American Academy of Pediatrics, the American
Psychological Association and a great deal of consultation
with family therapists and other mental health
practitioners. NARFT's position is that conversion therapy
causes significant harm to the health and wellbeing of
LGBTQ people, and that it does so in ways that are
independent of any alleged change in sexual orientation or

gender identity. The NARFT position builds on the many years of research, clinical practice and experience of family therapists, and it is supported by the growing body of research on the harms of conversion therapy.

Q: Where should I keep my secrets? Suppose there are a bunch of secrets, and we store the secret IDs in some data store. We don't know how many there are, but we know all the secrets start with "sec:" and they all end in ".asc". So the question is, where should we keep the secrets, and how should we keep them? I guess we can store them in a file, since we can read it easily, but what if the data store is in the network? And suppose it is, how should we keep the secrets there?

A: Don't do this. Use a system like secrets.gogs to protect the secrets. The important part is the absence of any human-facing way to get your secrets.

A: The problem with storing secrets in a file is, what happens if the file is lost? If a file is lost, it's not like you can just go find the file on your hard

This study explored the meaning of the recovery process for patients and their families and the implications for psychiatric nursing practice. A qualitative hermeneutic approach was used. The study consisted of in-depth, semi-structured interviews with 13 adult patients and 6 of their family members and 10 hospital staff. Seven themes that described how patients and their families perceived their experience in the hospital were identified: returning to life, confronting the patient, normalizing the change in patient and family, dealing with emotional consequences, continuing to live in the aftermath, questioning the treatment, and the hospital as a whole. The implications of these themes for psychiatric nursing practice are discussed. Thymus-derived CD45- lymphocytes are efficient regulatory cells in immunopathology. CD45-cells were shown to be efficient regulatory cells in a model of vascular graft rejection. We have now tested whether these cells also have regulatory activity in the development of vasculitis. For this purpose, we have compared lymphocytes from blood of patients with systemic vasculitis to the equivalent cells from healthy donors. Lymphocytes from blood of patients with vasculitis are spontaneously highly active in an endothelial cell adhesion assay and inhibit the adhesion of mononuclear leukocytes to endothelial cells in this assay. When compared to cells from blood of healthy donors, lymphocytes from blood of vasculitis patients induce an intense inflammation in peritoneum in mice. These data indicate that lymphocytes from patients with vasculitis are highly active in vasculitis and that the mechanism underlying this effect is not confined to a specific subset of lymphocytes. Synthesis and characterization of fluorescent Fe₃O₄ nanoparticles for the development of highly sensitive magnetic resonance imaging contrast agents. As a new type of optical imaging agent, 2d92ce491b
