Sep 13, 2019 I thought this could only happen when playing from USB and in cutscenes, but in my case it happens during gameplay too, making gaming pretty . Category:Science fiction films by series Category:Lists of films by genreQ: How to reload Fragment and update UI in Android? I have a screen with a button that opens another fragment. On this fragment I have a button that needs to change the text on another fragment. But on my button click method, my app just crashes. I understand that this is because my fragment is already destroyed. I tried to put the init method of my fragments in the onCreateView of my activity but it didn't work. What is the proper way to do it? A: The proper way to do it is to create a new Fragment in your Activity with its onCreateView being implemented. In this case the Fragment will be completely independent of the state of the activity that is hosting it. The view hierarchy of the Fragment will be constructed, any OnClickListener can be attached, and finally the Fragment can be initialized. In the end, the Fragment will be added to the activity's fragmentManager and attached to the view hierarchy. See, for example, the new, Fragment-related docs. Update: Now that you updated your question I understand your situation better. You want to change the Text of a button in a Fragment that you open with a Button Click. First, that is not how Fragments are meant to be used. You can not change any UI element in a fragment. This can be done only in your activity. Second, you probably want to create a method in your Activity that does what you want (e.g. changes the Text of the button). This method should be called after the Fragment has been attached to the activity and the UI elements have been inflated (i.e. the method is called after onCreateView() has been implemented). The proper way to do it is to create a method in your Activity that does what you want (e.g. changes the Text of the button). This method should be called after the Fragment has been 2d92ce491b
